Searching for STATION

Automatic Tuning

Pressing the Up or Down button for a moment causes automatic up or down searching for a station at the speed of 180ms/ch until the terminal activates (active LOW) or any button is pressed.

Manual Tuning

Momentarily pressing the Up or Down button tunes to the next channel and holding down the button for more than 0.5 seconds allows the Tuner to move up or down the entire band at the speed of 180ms/ch until the key is released.

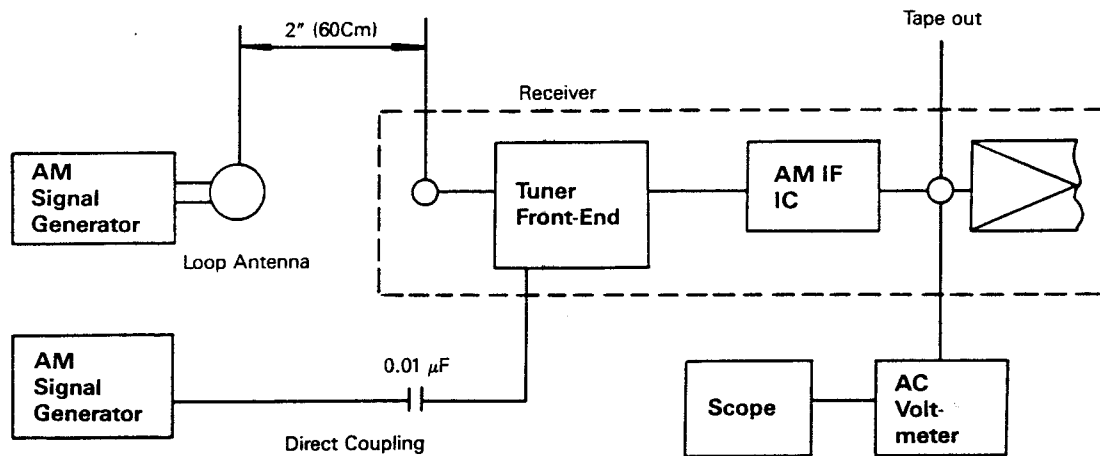

Memory Tuning

Memory

The tuning information is stored into an internal RAM by pressing the MEMORY key and then the desired memory tuning key within 5 seconds from the time the MEMORY key is initially pressed. If no key is pressed during this 5 sec. period, the MEMORY function is cancelled.

M1 to M10

Thirty AM and FM stations can be recalled from internal RAM. When it is switched from one band to the other band, the Tuner tunes to the station last tuned on that band. Each time a station is changed, the controller provides a signal to mute the tuner.

AM Alignment Connection

CIRCUIT DESCRIPTION

IC201 CXP50112

Input and Output Terminal Functions

Pin No.	I/O	Description
P34(V _{DD})	Input	Positive power supply pin.
P71(V _{SS})	Input	GND pin.
P74(EXTAL)	Input	Clock generator circuit input pin. A crystal oscillator or ceramic resonator is to be connected between the EXTAL and XTAL pins. When using an external clock input, connect a clock generation source to the EXTAL pin and leave the XTAL pin open.
P72(XTAL)	Output	Clock generator circuit output.
P32($\overline{\text{RST}}$)	Input/ Output	This is the output of the built-in power-ON-reset circuit. When an external reset signal is to be received, this pin must be maintained at a Low-level(0V) for a period of at least 2 instruction cycles.
P29 (INT)	Input	Interrupt input pin. Either the edge or level mode is selected according to the program.
P43 ($\overline{\text{EC}}$)	Input	Event counter input pin.
P46 (SI/PX2)	Input	Performs both the serial interface (8-bit) input pin and port X bit 2 (input) functions.
P45 (SO/PX1)	Input/ Output	Performs both the serial interface (8-bit) output pin and port X bit 1 (input) functions.
P44(SC/PX0)	Input/ Output	Performs both the serial interface clock I/O pin and Port X bit 0 (input) functions.
P62(RMC/PY3)	Input	Performs both the remote control input pin and port Y bit 3(input) functions.
P61(WP/PY2)	Input	Performs both the standby state clearing wake-up input and the port Y bit 2(input) functions.
P60(PWM/PY1)	Output	Performs both the PWM generator(14-bit) output and port Y bit 1 (Output) functions.
P59(PY0)	Output	Port Y bit 0 output pin.
P47~P50 (PA0~PA3)	Input/ Output	4-bit I/O port. Each bit can be programmed to be either an input or output. The tristate output configuration is employed.
P39~P42 (PB0/AD4~ PB3/AD7)	Input/ output	4-bit I/O port which performs the same functions as port A and doubles as the A/D converter input pin.
P67~P70 (PC0~PC3)	Input/ output	4-bit I/O port. Each bit can be programmed to be either an input or output. The tristate output configuration is employed.
P63~P66 (PD0~PD3)	Input/ output	4-bit I/O port which performs the same functions as port C.
P55~P58 (PE0~PE3)	Input/ output	4-bit I/O port which performs the same functions as port C.

Pin No.	I/O	Description
P51~P54 (PF0~PF3)	Input/ output	4-bit I/O port which performs the same functions as port C.
P35~P38 (PI0/AD0~ PI3/AD3)	Input/ output	4-bit I/O port which performs the same functions as port C and doubles as the A/D converter input pin.
P76(V _{FDP})	Input	Load power supply pin which is required when the FDP (fluorescent display tube) output driver incorporates a load resistor.
P21~P28 (T0~T7)	Output	Output pin for the 8 low-order bits of the FDP timing signal.
P13~P20 (T8/S23~ T15/S16)	Output	Output pin for both the segment signal and the 8 high-order bits of the FDP timing signal.
P1~P4 (PG0/S4~ PG3/S7)	Output	Performs both the 4-bit output port and the FDP segment signal output pin functions.
P77~P80 (PH0/S0~ PH3/S3)	Output	Same as port G.
P9~P12 (PJ0/S12~ PJ3/S15)	Output	Same as port G.
P5~P8 (PK0/S8~ PK3/S11)	Output	Same as port G.
P31(TEX)	Input	32 kHz timer clock generator circuit input pin. A 32.768kHz crystal oscillator is to be connected between the TEX and TX pins. When using this pin as the event clock input pin, connect a clock generation source to the TEX pin and leave the TX pin open.
P30(TX)	Output	Clock generator circuit output.
P75(V _{REF})	Input	Reference voltage input for the supply voltage reset circuit. A zener diode should normally be connected to this pin.

ALC CIRCUITS AND FIXED RECORD LEVELS

Certain products are designed to accommodate a reduced degree of user involvement and know-how when making tape recordings by omitting the manual record level controls and meters. This is especially common in music centers and cassette players where convenience and ease of operation are of primary importance. In order to enable good recordings to be made, it is then necessary to control the audio levels in the product in a predetermined manner. This can be done by installing an automatic level control (ALC) circuit or by presetting the source signal levels to an appropriate fixed value. The method selected for a given product will depend on the acceptable degree of record level error and its consequences.

DEFINITIONS

For purposes of discussion, it is necessary to define some terms relating to signal levels for products with ALC circuits or fixed record levels.

An ALC circuit consists of a level detector circuit which controls a variable gain stage such that once a predetermined signal level is reached, gain is reduced in order to prevent the signal from increasing further. Until such attenuation occurs, the circuit is operating at maximum gain. To disable the ALC means to hold the circuit at the maximum gain condition under all input signal conditions.

- a. Input sensitivity: V_{IN} . The input level which gives Dolby level voltage at the Dolby Test Point. (ALC disabled.)
- b. Transfer level. The level at the Dolby Test Point relative to Dolby level when a signal source is operating at a reference modulation level. (ALC disabled).

In products with fixed record levels, the designer must define the transfer levels so that reasonably good results will be obtained with available source material.

The following terms apply only to ALC-equipped products. Refer to Fig. 1.

- c. Reference voltage: V_{REF} . The input level which gives limiting level at the Dolby Test Point with the ALC disabled. In the example of Fig. 1, the limiting level is 2 dB above Dolby level at the output. Therefore, V_{REF} is 2 dB above V_{IN} .
- d. Limiting level. The level at the Dolby Test Point relative to Dolby level with an input signal of $(V_{IN}+10\text{dB})$, with the ALC enabled.
- e. Attack time. The time required after the application of a 1kHz input signal for the output level at the Dolby Test Point to decay to 3 dB above its final value. Input level for this test is $(V_{REF}+10\text{dB})$.
- f. Release time. The time required for the signal at the Dolby Test Point to recover to 3dB below its final value. Time measurement starts when the input level is switched to $(V_{REF}-10\text{dB})$ after a preconditioning period with an input signal of $(V_{REF}+10\text{dB})$.
- g. Limiter distortion. Distortion measured at the Dolby Test Point with an input signal level of $(V_{IN}+10\text{dB})$.

Input and Output Terminal Functions

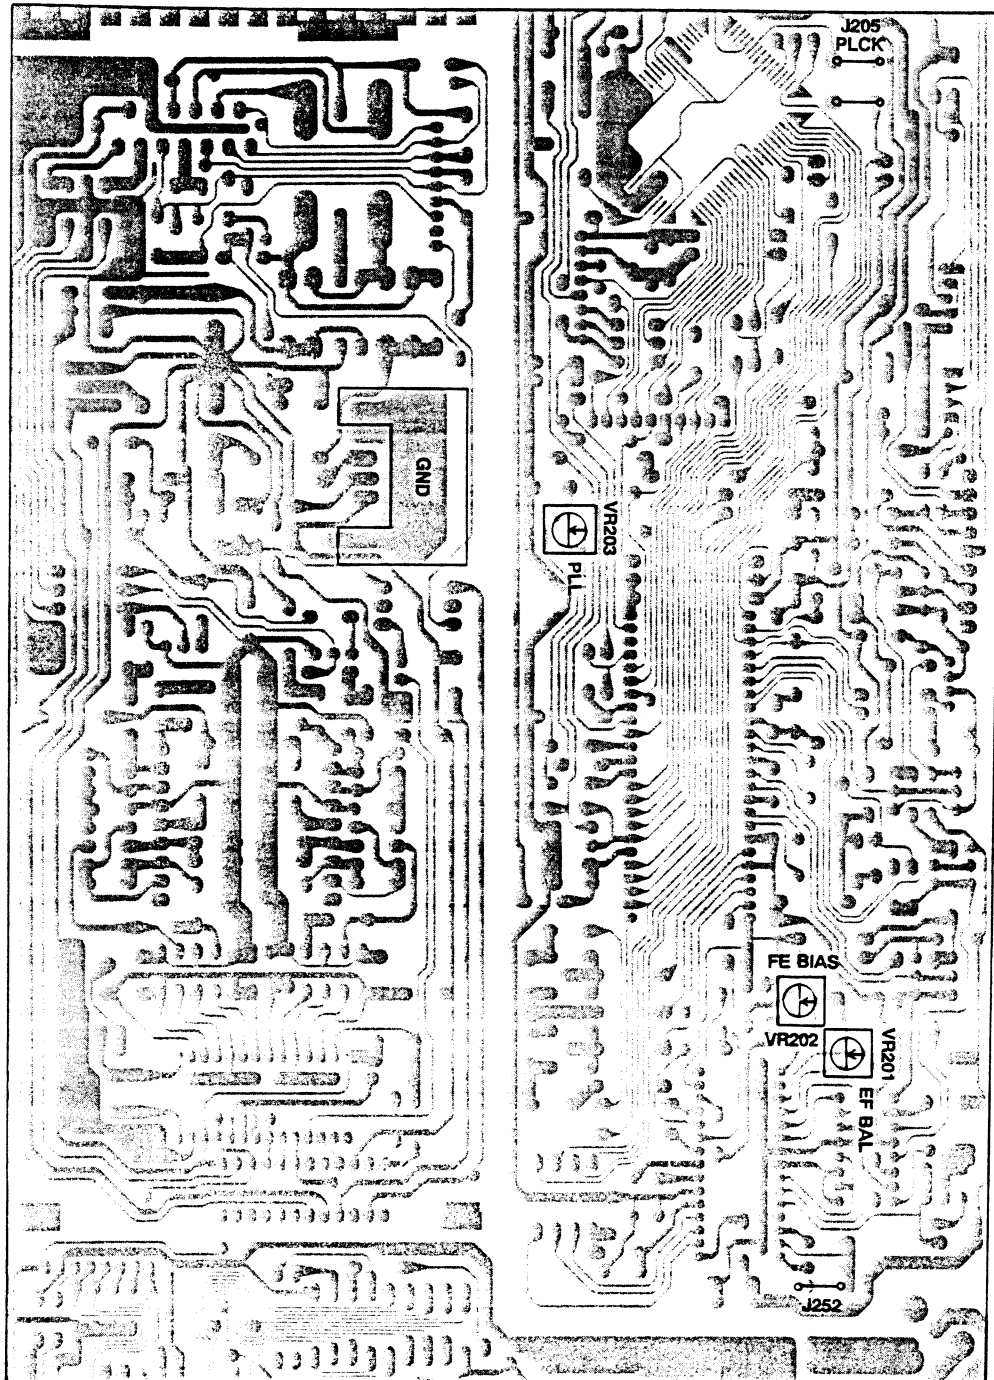

Pin No.	I/O	Description
P34(V _{DD})	Input	Positive power supply pin.
P71(V _{SS})	Input	GND pin.
P74(EXTAL)	Input	Clock generator circuit input pin. A crystal oscillator or ceramic resonator is to be connected between the EXTAL and XTAL pins. When using an external clock input, connect a clock generation source to the EXTAL pin and leave the XTAL pin open.
P72(XTAL)	Output	Clock generator circuit output.
P32($\overline{\text{RST}}$)	Input/ Output	This is the output of the built-in power-ON-reset circuit. When an external reset signal is to be received, this pin must be maintained at a Low-level(0V) for a period of at least 2 instruction cycles.
P29 (INT)	Input	Interrupt input pin. Either the edge or level mode is selected according to the program.
P43 ($\overline{\text{EC}}$)	Input	Event counter input pin.
P46 (SI/PX2)	Input	Performs both the serial interface (8-bit) input pin and port X bit 2 (input) functions.
P45 (SO/PX1)	Input/ Output	Performs both the serial interface (8-bit) output pin and port X bit 1 (input) functions.
P44($\overline{\text{SC}}$ /PX0)	Input/ Output	Performs both the serial interface clock I/O pin and Port X bit 0 (input) functions.
P62(RMC/PY3)	Input	Performs both the remote control input pin and port Y bit 3(input) functions.
P61(WP/PY2)	Input	Performs both the standby state clearing wake-up input and the port Y bit 2(input) functions.
P60($\overline{\text{PWM}}$ /PY1)	Output	Performs both the PWM generator(14-bit) output and port Y bit 1(Output) functions.
P59(PY0)	Output	Port Y bit 0 output pin.
P47~P50 (PA0~PA3)	Input/ Output	4-bit I/O port. Each bit can be programmed to be either an input or output. The tristate output configuration is employed.
P39~P42 (PB0/AD4~ PB3/AD7)	Input/ output	4-bit I/O port which performs the same functions as port A and doubles as the A/D converter input pin.
P67~P70 (PC0~PC3)	Input/ output	4-bit I/O port. Each bit can be programmed to be either an input or output. The tristate output configuration is employed.
P63~P66 (PD0~PD3)	Input/ output	4-bit I/O port which performs the same functions as port C.
P55~P58 (PE0~PE3)	Input/ output	4-bit I/O port which performs the same functions as port C.

Pin No.	I/O	Description
P51~P54 (PF0~PF3)	Input/ output	4-bit I/O port which performs the same functions as port C.
P35~P38 (PI0/AD0~ PI3/AD3)	Input/ output	4-bit I/O port which performs the same functions as port C and doubles as the A.D converter input pin.
P76(V _{FDP})	Input	Load power supply pin which is required when the FDP (fluorescent display tube) output driver incorporates a load resistor.
P21~P28 (T0~T7)	Output	Output pin for the 8 low-order bits of the FDP timing signal.
P13~P20 (T8/S23~ T15/S16)	Output	Output pin for both the segment signal and the 8 high-order bits of the FDP timing signal.
P1~P4 (PG0/S4~ PG3/S7)	Output	Performs both the 4-bit output port and the FDP segment signal output pin functions.
P77~P80 (PH0/S0~ PH3/S3)	Output	Same as port G.
P9~P12 (PJ0/S12~ PJ3/S15)	Output	Same as port G.
P5~P8 (PK0/S8~ PK3/S11)	Output	Same as port G.
P31(TEX)	Input	32 kHz timer clock generator circuit input pin. A 32.768kHz crystal oscillator is to be connected between the TEX and TX pins. When using this pin as the event clock input pin, connect a clock generation source to the TEX pin and leave the TX pin open.
P30(TX)	Output	Clock generator circuit output.
P75(V _{REF})	Input	Reference voltage input for the supply voltage reset circuit. A zener diode should normally be connected to this pin.
